NRAP Tool Webinar Series

Webinar 7

Short term seismic forecasting tool -STSF

Monday November 30, 2015

OVERVIEW

- **Welcome and Overview of NRAP – Technical Approach and Tool Development**
- **Introduction to the NRAP Short Term Seismic Forecasting Tool (STSF)**
- **What does STSF do?**
- **What is the Empirical Type AfterShock (ETAS) model?**
- **How to run to the STSF tool**
 - **What input is needed**
 - **What output is created**
- **Questions and Open Discussion**

National Risk Assessment Partnership (NRAP)

NRAP leverages DOE's capabilities to help quantify uncertainties and risks necessary to remove barriers to full-scale CO₂ storage deployment.

Objective: *Building toolset and improving the science base to address key questions about potential impacts related to release of CO₂ or brine from the storage reservoir, and potential ground-motion impacts due to injection of CO₂*

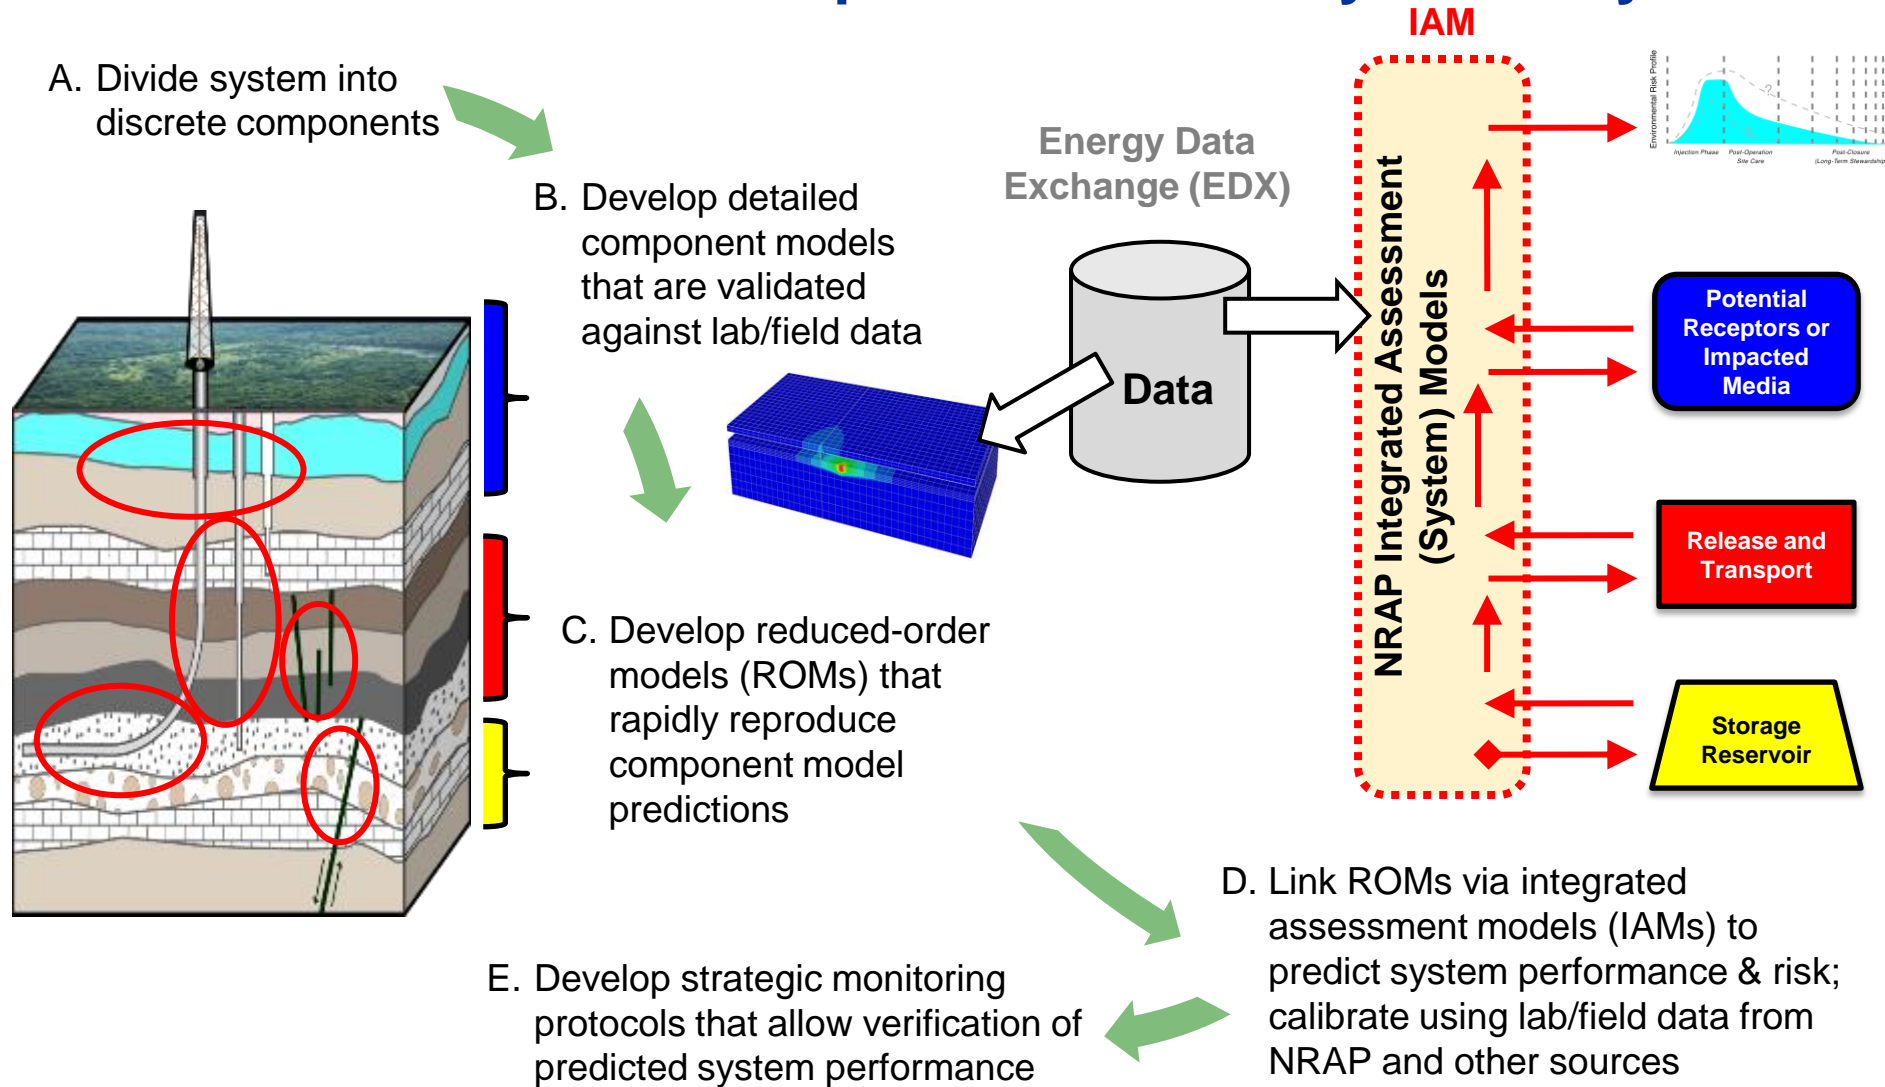

Technical Team

Stakeholder Group

NRAP's approach to quantifying performance relies on reduced-order models to probe uncertainty in the system.

Schedule for NRAP Tool Webinar Series

Date/ Time	Tool	Presenter(s)
October 13 Time: 1pm ET	Integrated Assessment Model–Carbon Storage (NRAP-IAM-CS) (2.5 hours)	Rajesh Pawar
October 19 Time: 1pm ET	Natural Seal ROM (NSealR) (1 hour)	Nicolas Huerta, Ernest Lindner
October 26 Time: 1pm ET	Reservoir Evaluation and Visualization (REV) Tool (1 hour)	Seth King
November 2 Time: 1pm ET	Wellbore Leakage Analysis Tool (WLAT) (1.5 hour)	Nicholas Huerta
November 9 Time: 1pm ET	Aquifer Impact Model (AIM) (1.5 hour)	Diana Bacon
November 16 Time: 1pm ET	Design for Risk Evaluation and Monitoring (DREAM) (1 hour)	Catherine Ruprecht Yonkofski
November 30 Time: 1pm ET	Short Term Seismic Forecasting (STSF) (1 hour)	Josh White, Corinne Bachmann
December 7 Time: 1pm ET	Integrated Assessment Model–Carbon Storage (NRAP-IAM-CS) and REV Tool (1.5 hours)	Rajesh Pawar, Seth King

Check for updates at www.edx.net/ldoe.gov/nrap

What does STSF do?

Problem statement:

We have ongoing seismicity during an injection and we want to model the behavior of the events.

Solution:

The STSF tool uses a model developed for the decay of aftershocks of large seismic events to determine the event rate in future time bins. It also fits the injection parameters of the ongoing project

- Uses the ETAS model
- Can use different injection parameters as input
- Predicts event rates above a pre-determined magnitude threshold
- Can be used in real-time in an ongoing project

Epidemic Type Aftershock Sequence Model (ETAS)

- Originally developed by Ogata in 1988 to determine the occurrence of aftershock after a main shock / large event.
 - Each earthquake has the ability to trigger aftershocks
 - ETAS is a cascading model

Epidemic Type Aftershock Sequence Model (ETAS)

- Originally developed by Ogata in 1988 to determine the occurrence of aftershock after a main shock / large event.

$$\lambda_i(t) = \frac{K}{(c + t - t_i)^p} 10^{\alpha(M_i - M_{\min})}$$

$$\lambda(t) = \lambda_0 + \sum_{[i:t < t_i]} \lambda_i(t)$$

Background Term

Triggered Term

Epidemic Type Aftershock Sequence Model (ETAS)

- To adapt for injection induced seismicity, a term is added into the background:

$$\lambda(t) = \lambda_0 + \sum_{[i:t < t_i]} \lambda_i(t)$$

- $Fr(t)$ is originally the injection rate, but this can be adapted, cf is a fitted constant

$$\lambda_0(t) = \mu + c_f \times Fr(t)$$

ETAS Code

- **There are several adaptations of the ETAS frame set**
 - We use a code written by Prof. S. Hainzl at GFZ Potsdam
- **All codes are written in C++ and originally called by a Perl script**
- **Matric Research has turned the Perl Script into a GUI**

How to install the STSF Tool

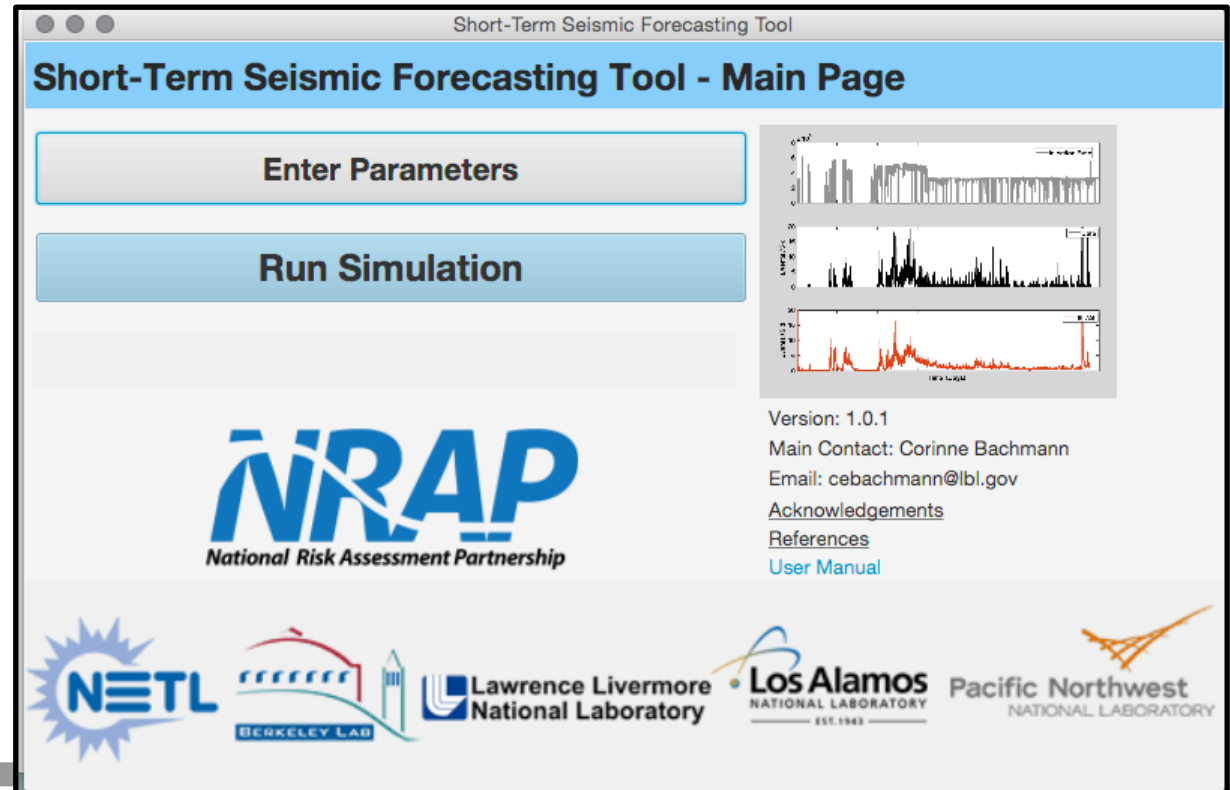

- **The tool package is a zip file on EDX**
 - Unpacking the zip file creates a folder with all files needed
- **Currently only tested on Mac OSX and Linux**
- **Requires Java Runtime Environment (JRE) version 8 update 40 or newer**
 - Current version is 51, might need restart after update
- **Requires gcc**

How to run the STSF Tool

- To run the GUI

`sh bin/application`

- has to be run in a shell script from the main tool folder

GUI- Input

- The GUI needs two files
 - Catalog Data
 - Injection Data

Short-Term Seismic Forecasting Tool

File

Parameters

Catalog File: [] Browse

Flow File: [] Browse

Catalog Type: Original Input Option: Flow_In

Mag Complete: 0.9 Max Mag: 7

Time Est: 0.5 Time Forecast: 1.0

ΔT: 0.5 Step size: 0.5

Total Steps: 5 Synthetic Sim: 1000

b-value: 1 b-value Events: 4000

c-value: 0.01 [x] Estimated c-value

alpha-value: 0.8 [x] Estimated alpha-value

p-value: 1.2 [x] Estimated p-value

GUI- Options

- Different input parameters can be varied/fixed

The screenshot displays the 'Short-Term Seismic Forecasting Tool' window. It features a 'File' menu and a 'Parameters' tab. The parameters are organized into several sections: 'Catalog File' and 'Flow File' with 'Browse' buttons; 'Catalog Type' (set to 'Original') and 'Input Option' (set to 'Flow_In'); 'Mag Complete' (0.9), 'Max Mag' (7), 'Time Est' (0.5), and 'Time Forecast' (1.0); 'ΔT' (0.5), 'Step size' (0.5), 'Total Steps' (5), 'Synthetic Sim' (1000), 'b-value' (1), and 'b-value Events' (4000); 'c-value' (0.01) with a checked 'Estimated c-value' box; 'alpha-value' (0.8) with a checked 'Estimated alpha-value' box; and 'p-value' (1.2) with a checked 'Estimated p-value' box. At the bottom, there is a note: '*Hover your pointer over a label to show its description here.' followed by radio buttons for 'Standard' (selected) and 'Future'. A red box highlights the 'Cancel' and 'Save' buttons at the bottom right.

Revert Parameters to Defaults Cancel Save

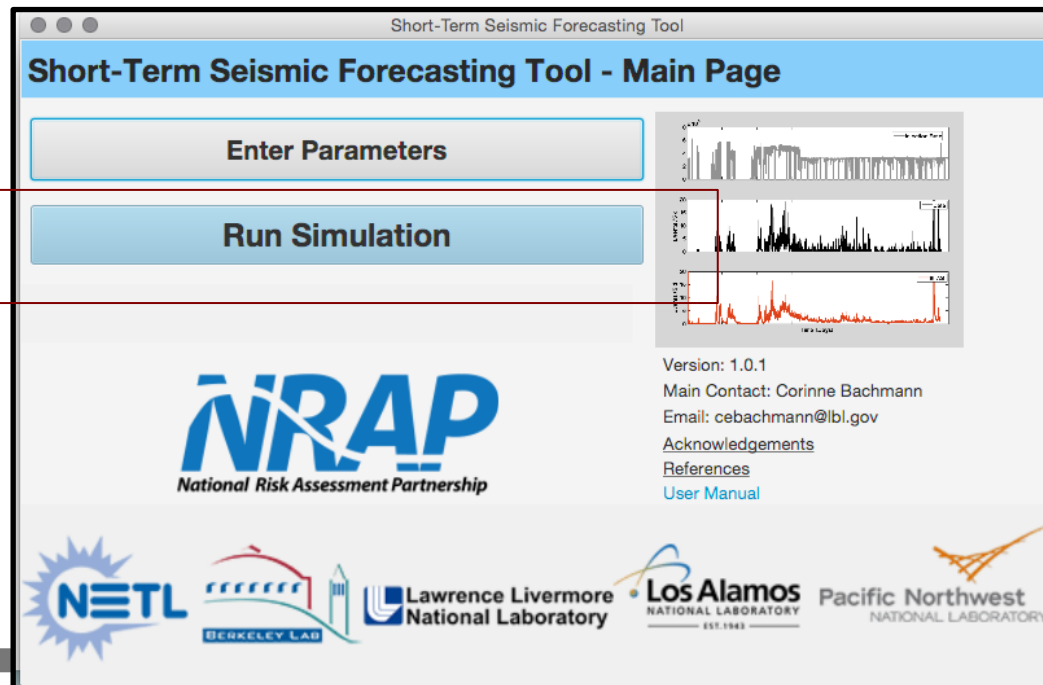

GUI- Options

- Saving parameters returns the GUI to the start frame
- More information about parameters can be found in the User Manual

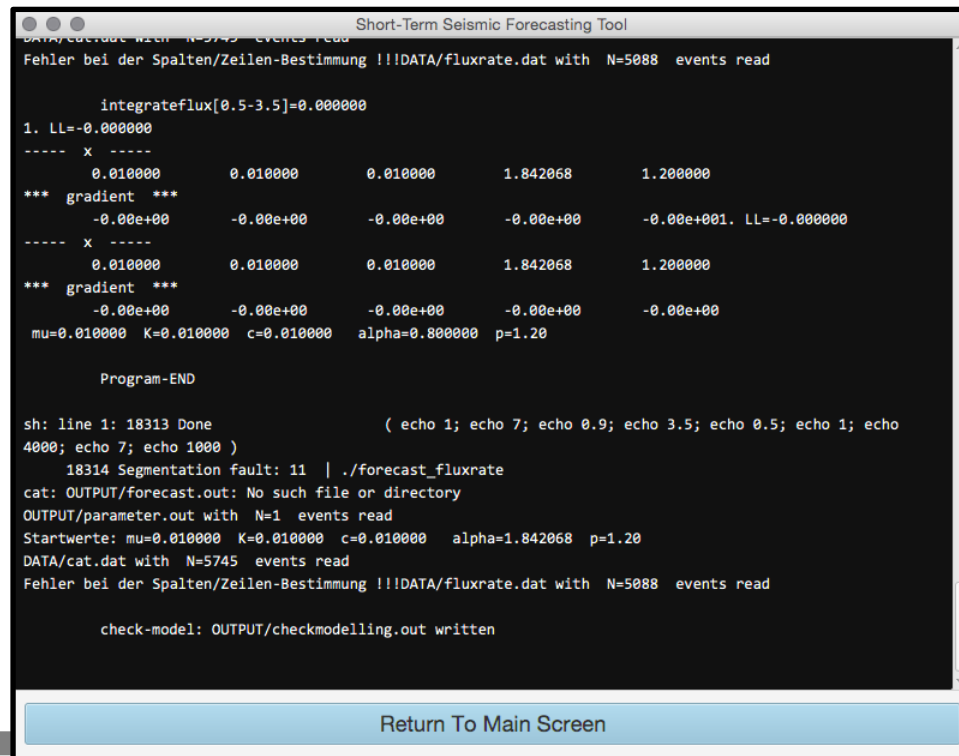

GUI- Running a simulation

- A simulation is run with the 'Run Simulation' button
- Before the first run, parameters have to be set and input files have to be chosen

GUI- Running a simulation

- A simulation run opens a shell script output
- The run is finished when the 'Return to Main Screen' button is highlighted

The screenshot shows a window titled "Short-Term Seismic Forecasting Tool" with a black background and white text. The text is a shell script output. At the bottom of the window, a light blue button labeled "Return To Main Screen" is highlighted.

Output files

- Output files are written in the tool folder
 - bin/OUTPUT
 - One file with calculated parameters

	#	tstart	tend	N	mu	K	c_[days]	alpha_with10^alpha*M	p	maxgrad	AIC	
1	#	tstart	tend	N	mu	K	c_[days]	alpha_with10^alpha*M	p	maxgrad	AIC	
2	0.500	1.000	22	0.126141	0.000000	0.010000	0.800000	1.200000	6.655767e-04	-39.036473		
3	#	tstart	tend	N	mu	K	c_[days]	alpha_with10^alpha*M	p	maxgrad	AIC	
4	0.500	1.500	43	0.101337	0.000000	0.010000	0.800000	1.200000	1.479497e-03	-95.992653		
5	#	tstart	tend	N	mu	K	c_[days]	alpha_with10^alpha*M	p	maxgrad	AIC	
6	0.500	2.000	60	0.083675	0.000000	0.001143	1.562404	3.441481	2.693611e+03	-138.509686		

- One file with calculated rates

1	1.000000	1.500000	29.460000
2	1.500000	2.000000	23.425000
3	2.000000	2.500000	31.699000

- From day 1 to 1.5 29.46 events above magnitude of completeness were forecast

Output files

- **Output files are written in the tool folder**
 - bin/OUTPUT
 - The files have a standard name and will be overwritten by a new run
 - allforecast_fut.out and allparameter_fut.out
 - To save the output of one run, files have to be renamed manually
 - Possibility of determining output name files could be added in a newer version

Output Examples

- Output example with event forecast in 5 day bins over a 20 year injection

Output Examples

- Output example with event forecast in 0.25 day bins for a 6 day injection
 - E2,E4 and E5 are different realizations of the model

Output Examples

- Events above a certain magnitude with time

Schedule for NRAP Tool Webinar Series

Questions?

Seismic Short Term Forecasting (STSF) tool

**Questions/comments not addressed during the
scheduled meeting time can be addressed to
cebachmann@lbl.gov**

GUI- Options

- Different input parameters can be varied/fixed

Magnitude of completeness of input catalog

Time when the first parameters will be estimated

Size of forecast window in days

Total number of time steps to forecast

b-value of GR law

The screenshot shows the 'Short-Term Seismic Forecasting Tool' window. It has a 'File' menu and a 'Parameters' tab. The parameters are organized into two columns. The left column includes 'Catalog File', 'Flow File', 'Catalog Type' (set to 'Original'), 'Mag Complete' (0.9), 'Time Est' (0.5), 'ΔT' (0.5), 'Total Steps' (5), 'b-value' (1), 'c-value' (0.01), 'alpha-value' (0.8), and 'p-value' (1.2). The right column includes 'Input Option' (set to 'Flow_In'), 'Max Mag' (7), 'Time Forecast' (1.0), 'Step size' (0.5), 'Synthetic Sim' (1000), and 'b-value Events' (4000). At the bottom, there are checkboxes for 'Estimated c-value', 'Estimated alpha-value', and 'Estimated p-value', all of which are checked. There are also radio buttons for 'Standard' (selected) and 'Future'. A note at the bottom says '*Hover your pointer over a label to show its description here.' At the very bottom are buttons for 'Revert Parameters to Defaults', 'Cancel', and 'Save'. Arrows from external text boxes point to specific fields: 'Mag Complete' to 0.9, 'Time Est' to 0.5, 'ΔT' to 0.5, 'Total Steps' to 5, 'b-value' to 1, 'Max Mag' to 7, 'Time Forecast' to 1.0, 'Step size' to 0.5, 'Synthetic Sim' to 1000, and 'b-value Events' to 4000.

Parameter	Value
Catalog File	
Flow File	
Catalog Type	Original
Mag Complete	0.9
Time Est	0.5
ΔT	0.5
Total Steps	5
b-value	1
c-value	0.01
alpha-value	0.8
p-value	1.2
Input Option	Flow_In
Max Mag	7
Time Forecast	1.0
Step size	0.5
Synthetic Sim	1000
b-value Events	4000

Maximum Magnitude assumed for forward simulation

Size of forecast window in days

Step size between time windows

Number of synthetic forward

Number of events needed to determine b-value
